

Emergency communication base station equipment manufacturers

What makes a good emergency communication system?

An emergency communication system should include portable power, such as a gas-powered generator, and internet connectivity that doesn't depend on ground-based service. Satellite communication is ideal because it is not dependent on infrastructures such as buried cables and cell towers that might be disabled during a natural disaster.

Why do you need emergency communications equipment?

Contact Hughes today to pre-plan, pre-order and pre-stage your emergency communications equipment so you can keep your personnel, first responders, dispatch centers and citizens connected. When terrestrial lines fail due to natural or manmade disaster, emergency communications systems keep front-line workers and communities connected.

Does EMS have a 911 system?

We have fully incorporated the 911 System in our EMS station, including speakers and lights in all rooms, training room, bunk rooms, garage bay in several locations, bathrooms, etc.; there is nowhere in the station you can go without knowing we have a dispatched call.

Why should emergency communications be simple and fast?

Deploying emergency communications needs to be simple and fast. The first 24 hours of the response plan are the most vital and chaotic. Storms, fires, earthquakes, floods, and other natural disasters will likely disrupt ground-based connections, including cell phone towers.

Who benefits from emergency satellite communications?

Home improvement stores, insurance agents, medical facilities, and others benefit from emergency satellite communications. A complete disaster communication plan will include VoIP telephones and Wi-Fi access points to extend the reach of communication and information access.
