

# How big a battery is needed for home energy storage

How much power does a battery system need?

For example, if your critical loads require 2,000 watts of power and you need backup power for 24 hours, your total load would be 48,000 watt-hours (2,000 watts x 24 hours). Once you have determined your total load, you can select a battery system that can meet your power needs.

Should you put battery storage in your home?

In short, battery storage in your home can bring the following benefits: Let's say your home has solar panels on the roof or even a wind turbine in the back garden. Without battery storage, a lot of the energy you generate will go to waste.

Do I need a larger battery system?

For example, if you live in an area prone to extended power outages, you may need a larger battery system that can provide power for several days. Once you have determined your average power consumption, critical loads, and backup duration, you can calculate your total load.

Can a home backup battery system power my home?

A home backup battery system can provide peace of mind and ensure that you have power during an unexpected outage or emergency. However, to ensure that your backup battery system can effectively power your home, it is essential to accurately estimate your power needs and select the appropriate battery system.

How do I choose a battery system?

Battery systems are rated in terms of their energy storage capacity, typically in kilowatt-hours (kWh). You should select a battery system that has enough storage capacity to meet your total load. For example, if your total load is 48,000 watt-hours, you should select a battery system with a storage capacity of at least 48 kWh.

Can domestic battery storage be used without renewables?

Short answer: yes. Domestic battery storage without renewables can still benefit you and the grid. This is especially true for those on smart tariffs; charge your battery during cheaper off-peak hours and discharge during more expensive peak hours, cutting your bills and reducing strain on the grid during peak energy use times.
