

# How to optimize wind and solar complementarity for communication base stations

Can a multi-energy complementary power generation system integrate wind and solar energy?

Simulation results validated using real-world data from the southwest region of China. Future research will focus on stochastic modeling and incorporating energy storage systems. This paper proposes constructing a multi-energy complementary power generation system integrating hydropower, wind, and solar energy.

Is a multi-energy complementary wind-solar-hydropower system optimal?

This study constructed a multi-energy complementary wind-solar-hydropower system model to optimize the capacity configuration of wind, solar, and hydropower, and analyzed the system's performance under different wind-solar ratios. The results show that when the wind-solar ratio is 1.25:1, the overall system performance is optimal.

What are the complementary characteristics of wind and solar energy?

The complementary characteristics of wind and solar energy can be fully utilized, which better aligns with fluctuations in user loads, promoting the integration of wind and solar resources and ensuring the safe and stable operation of the system.

How to optimize wind and solar energy integration?

The optimization uses a particle swarm algorithm to obtain wind and solar energy integration's optimal ratio and capacity configuration. The results indicate that a wind-solar ratio of around 1.25:1, with wind power installed capacity of 2350 MW and photovoltaic installed capacity of 1898 MW, results in maximum wind and solar installed capacity.

How can unified scheduling improve energy utilization in integrated energy systems?

These models aim to improve utilization through unified scheduling within integrated energy systems, while combining renewable energy with energy storage systems can enhance the profitability and cost-effectiveness of system operations.

Can a multi-energy complementary system be integrated into a primary power grid?

Therefore, if this multi-energy complementary system is integrated into the primary power grid to supply electricity to customers sensitive to electricity prices, minor adjustments in the electricity consumption habits of users can effectively accommodate a large amount of new energy electricity.

technologies that combine wind and solar energy, are particularly important because they improve the stability and efficiency of energy supply. Through the analysis of technological innovation ...
