

# Where do the photovoltaic panels generate electricity

How do solar PV panels generate electricity?

In conclusion, solar PV panels generate electricity by converting sunlight into electricity through the photovoltaic effect. This clean and renewable source of energy is becoming increasingly popular in the UK and around the world as a way to reduce carbon emissions and combat climate change.

How do solar cells generate electricity?

When photons hit the solar cells, they create an electric field at the junction between the layers. This electric field knocks electrons loose from the atoms in solar cells, setting them in motion. The electrons flow through the solar cell and out of the junction, generating an electrical current.

How does photovoltaic (PV) technology work?

Learn the basics of how photovoltaic (PV) technology works with these resources from the DOE Solar Energy Technologies Office. Solar photovoltaic modules are where the electricity gets generated, but are only one of the many parts in a complete photovoltaic (PV) system.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.

How do solar panels convert light into electricity?

Solar panels convert the energy of photons (light particles) into electricity (as we discuss in The Beginner's Guide to Solar Energy). This process is called the photovoltaic effect. When a photon hits a photovoltaic (PV) device, its energy is transferred from the photon to the local electrons in the material.

How do solar panels convert solar energy into heat?

Instead, the solar panels, known as "collectors," transform solar energy into heat. Sunlight passes through a collector's glass covering, striking a component called an absorber plate, which has a coating designed to capture solar energy and convert it to heat.
